

CUSTOM APPLICATION CASE STUDY

“INVENTORY & DISTRIBUTION OF INDUSTRIAL GASES”

Premise

The distribution network for industrial gases has a lot of paperwork at each stage, from procurement of materials to processing them and handling dealer related information. There was a need to automate this system

Research & Insight

We developed a cloud based system to tackle this challenge on multiple fronts. A web-based application for the back end inventory management operations and a point of sale mobile application for the front end distribution management operations.

Solution

Minimising paperwork and streamlining of the operations meant that pilferage was eliminated. Dealer-wise sales reports could be generated and complete integration of forward and backward logistics was done for the down stream process. An additional option of using the system for direct retail sales was also provided with DC - Invoice conversion.
